

SI misspecification: gradual Rt 1.1 -> 1.3 (20-day transition)

Data simulated with the TRUE SI (mean 7.5, sd 3.4); each line re-fits the same 100 epidemics with the assumed SI named in the key. I0 = 2000, T = 100. Lines = mean over epidemics; ribbons = mean 95% CrI. Dotted lines mark the transition (days 50–69). Scored and drawn from day 13 (common burn-in); axis ranges from day 25 (view only). Data: Poisson for EpiEstim and EpiFilter; negative binomial (rho = 20) for EpiLPS, which is fitted to days 8–100 and runs far off the scale on its first days.

SI misspecification: gradual Rt 1.1 -> 1.3 (20-day transition): coverage and interval width

Black line in the coverage panels = nominal 0.95. n_sim = 100.
